

Goal:

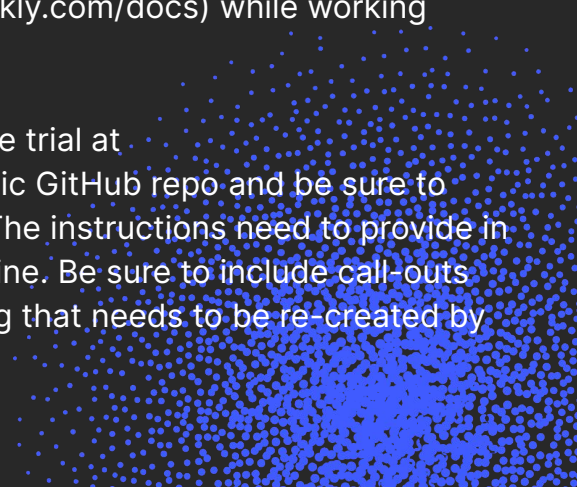

This exercise is to validate that you can use and quickly acclimate to the LaunchDarkly platform. It is not intended to test your application development skills.

Expectations:

- Create a feature flag in an implementation of your choice. [May be as simple or complex as you'd like.]
- You must use one of the LaunchDarkly SDKs to implement the feature flag.
- Bonus points for implementations that use targeting or other LaunchDarkly features besides the kill switch.

Please time box this section to no more than two hours. You may reference any additional resources including the LaunchDarkly documentation (<https://docs.launchdarkly.com/docs>) while working through it.

In order to complete this exercise, you will need to sign up for a free trial at <https://launchdarkly.com/start-trial/>. Upload your solution to a public GitHub repo and be sure to include instructions on how to set up the sample implementation. The instructions need to provide in detail how the reader can set the example up locally on their machine. Be sure to include call-outs where the SDK key needs to be replaced, as well as the feature flag that needs to be re-created by the user.
